

## Executive Summary

This Municipal Setting Designation (MSD) application is submitted for the designated property at 7721 Pinemont Dr., Houston, TX 77040 on behalf of Baker Hughes, the former property owner. The groundwater contamination beneath the property is the result of industrial activities, specifically related to the historical parts washer drain oil/water separator. The property is currently being used for industrial warehousing, and its current owner is 7721 Pinemont LLC. The Site is bordered by industrial properties to the west. The Site is bordered to the north by roadway (Pinemont Drive) and a mix of industrial, commercial, and office land use. The Site is bordered to the east by roadway (Clark Road), industrial and commercial properties. The Site is bordered to the south by industrial, commercial, and park/open space property. There are no known changes in planned future use of the Site and/or the properties in the vicinity of the Site.

Chemicals of Concern (COCs) in groundwater include tetrachloroethylene (PCE) and its daughter products/degradation byproducts: trichloroethylene (TCE), cis-1,2-dichloroethylene (cis-1,2-DCE), trans-1,2-dichloroethylene (trans-1,2-DCE), 1,1-dichloroethylene (1,1-DCE), and vinyl chloride (VC). This class of chemicals is generally referred to as chlorinated ethenes or chlorinated hydrocarbons. No non-aqueous phase liquid (NAPL) has been observed at the Site during groundwater monitoring, which has been ongoing since 2016.

The designated property has been in a State regulatory program since it was entered into the Texas Commission on Environmental Quality (TCEQ) Industrial and Hazardous Waste (IHW) Corrective Action Program on December 12, 2018. Its assigned Solid Waste Registration (SWR) ID is No. 88169. The applicable program rules are the Texas Risk Reduction Program (TRRP) rules (30 Texas Administrative Code (TAC) Chapter 350). Results of multiple subsurface investigations and ongoing semi-annual groundwater monitoring events have been submitted for the designated property and have been reviewed by the TCEQ. The status of the designated property in the IHW Corrective Action Program is “ongoing investigation and assessment”, and the TCEQ Corrective Action Program Project Manager assigned to the designated property is Timothy Brown.

During assessment efforts, exceedances of critical protective concentration levels (PCLs) in soil and groundwater were fully delineated to residential assessment levels (RALs), with the exception of those at MW-4, which is located on the west boundary of the property, hydraulically downgradient from neighboring industrial facilities, and hydraulically upgradient from the affected property on the Site. MW-4 is believed to be impacted by off Site sources, which is why no further delineation work was done. This assertion was supported by the TCEQ in the February 6, 2020, Affected Property Assessment Report (APAR) approval letter. Again, this area of contamination appears to be spatially limited, as groundwater from three adjacent wells downgradient from MW-4 (MW-7, MW-12, and MW-13) has had no detectable concentrations of chlorinated solvents over the 2016 through 2021 monitoring period.

Monitor well MW-1, located in the middle of the Site in the immediate area of the drainage outfall from the historical parts washer drain oil/water separator, has been identified as the on-Site source zone as described in the APAR (GHD, 2018) and Addendum to the APAR (GHD, 2019) which were approved by the TCEQ on February 6, 2020. This area of contamination appears to be spatially limited, as groundwater samples collected at a second well approximately 175 feet downgradient (monitor well MW-10) have not contained any appreciable concentrations of chlorinated solvents.

Baker Hughes and its consultants have completed routine groundwater monitoring events at the property since December 2016, and while no active remediation efforts have taken place, there appears to be credible evidence

of natural attenuation processes in the groundwater beneath the designated property. The primary lines of evidence for natural attenuation are: 1) a statistically significant decreasing trend for PCE concentrations in MW-1 for the most recent eight monitoring periods, 2) the presence of PCE daughter products in MW-1 (TCE, the isomers of DCE, and VC), and 3) decreasing concentrations of those daughter products, signaling complete reaction to ethene (which is not a regulated constituent).

In summary, the designated property meets all site eligibility requirements for the MSD program:

- The site is enrolled in a State cleanup program (TCEQ IHW Corrective Action under 30 TAC §350 TRRP Rules);
- The site has been thoroughly investigated with sufficient data, spanning from 2016 to present;
- The source of on-Site contamination is no longer in place;
- The on-Site groundwater plume has been delineated to the applicable RALs (i.e., groundwater ingestion (<sup>GW</sup>GW<sub>ing</sub>) PCL);
- The COC plume is stable both in terms of spatial extent as well as average concentration of COCs over time.

Exhibit A

Property Description

Restricted Reserve "A", Block 1, of WEATHERFORD HEMPSTEAD PINEMONT SUBDIVISION, a subdivision in Harris County Texas, according to the map or plat thereof recorded under Film Code Reference No. 627066 of the Map Records of Harris County, Texas.

RP-2017-64931

Permitted Exceptions

1. Real estate taxes and installments of assessments (and liens therefor) on the Property for the year of closing and subsequent years.
2. Restrictive covenants recorded in Volume 156, Page 32, and under Film Code No. 627066, both of the map records of Harris County, Texas, but omitting any covenant, condition, or restriction, if any, based on race, color, religion, sex, handicap, familial status or national origin unless and to the extent that the covenant, condition, or restriction (a) is exempt under Title 42 of the United States Code or (b) relates to handicap but does not discriminate against handicapped persons.
3. Utility easement ten (10) feet wide along the West property line, together with an unobstructed aerial easement five (5) feet wide from a plane twenty (20) feet above the ground upward, granted to Houston Lighting & Power Company by instruments filed for record under Harris County Clerk's File Nos. F552568 and F758382, as shown by the recorded plat filed under Film Code No. 627066 of the Map Records of Harris County, Texas.
4. Utility easement ten (10) feet wide along the most Southerly property line, together with an unobstructed aerial easement five (5) feet wide from a plane twenty (20) feet above the ground upward, granted to Houston Lighting & Power Company by instrument recorded in Volume 8514, Page 491, of the Deed Records of Harris County, Texas, as shown by the recorded plat filed under Film Code No. 627066 of the Map Records of Harris County, Texas.
5. Utility easement ten (10) feet wide along the most westerly East property line and extending in a Southerly direction the entire length thereof, together with an unobstructed aerial easement five (5) feet wide from a plane twenty (20) feet above the ground upward, granted to Houston Lighting & Power Company by instrument recorded in Volume 8514, Page 491, of the Deed Records of Harris County, Texas, as shown by the recorded plat filed under Film Code No. 627066 of the Map Records of Harris County, Texas.
6. An unobstructed aerial easement five (5) feet wide from a plane twenty (20) feet above the ground upward, located west of and adjoining the most westerly East line of the subject property, extending in a southerly direction from Pinemont Street 140 feet to a point for terminus, granted to Houston Lighting & Power Company by instrument recorded in Volume 6642, Page 265, of the Deed Records of Harris County, Texas, as shown by the recorded plat filed under Film Code No. 627066 of the Map Records of Harris County, Texas.
7. Building and set back line 25 feet wide along the North property line(s) abutting Pinemont Drive, as shown by the recorded plat filed under Film Code No. 627066 of the Map Records of Harris County, Texas.
8. Building set back line 25 feet wide along the southerly East property line(s) abutting Hollister Road, as shown by the recorded plat filed under Film Code No. 627066 of the Map Records of Harris County, Texas.
9. Terms, conditions, and stipulations contained in that certain Boundary Line Agreement by and between J.P. Hildenbrandt and A.G. Solleberger, dated December 13, 1966, recorded in Volume 6607, Page 401, of the Deed Records of Harris County, Texas.

10. Mineral and/or royalty interest recorded May 14, 1945 in Volume 1766, Page 712, of the Deed Records of Harris County, Texas.

11. Survey prepared by EBY Survey, Inc., on behalf of Old Republic Specialized Commercial Services, dated November 4, 2016, Project No. 01-16070838-01N, reveals the following: chain link fence is outside of west property line by 3.5 feet.

RECORDERS MEMORANDUM  
This instrument was received and recorded electronically  
and any blackouts, additions or changes were present  
at the time the instrument was filed and recorded.

Any provision herein which restricts the sale, rental, or  
use of the described real property because of color or  
race is invalid and unenforceable under federal law.  
THE STATE OF TEXAS  
COUNTY OF HARRIS

I hereby certify that this instrument was FILED in  
File Number Sequence on the date and at the time stamped  
hereon by me; and was duly RECORDED in the Official  
Public Records of Real Property of Harris County, Texas.

HARRIS COUNTY, TEXAS

# **Appendix B**

## **APPENDIX B**

*A description of the current use, and, to the extent known, the anticipated use(s), of the designated property and properties within 500 feet of the boundary of the designated property.*

The designated property (the Site) consists of an approximately 7.57-acre tract of land located at 7721 Pinemont Dr., Houston, TX 77040 (Harris County). The Site is improved with an approximately 66,818 square foot light industrial building with warehouse and office space. The Site is bordered by industrial properties to the west. The Site is bordered to the north by roadway (Pinemont Drive) and a mix of industrial, commercial, and office land use. The Site is bordered to the east by roadway (Clark Road), industrial and commercial properties. The Site is bordered to the south by industrial, commercial, and park/open space property. There are no known changes in planned future use of the Site and/or the properties in the vicinity of the Site. Underground public utilities are located within City of Houston rights-of-way (ROWs) to the north (water main, storm sewer, and sanitary sewer) and east of the Site (water main and sanitary sewer).

# **Appendix C**

## **APPENDIX C**

*A site map(s) showing:*

- a. *The location of the designated property.*
- b. *The topography of the designated property as indicated on publicly available sources, which must note the watershed including the nearest surface water body and whether the designated property is located in a floodplain or floodway, as those terms are defined in Chapter 19 of the Code of Ordinances.*
- c. *The detected area of groundwater contamination.*
- d. *The location of all soil sampling locations and all groundwater monitoring wells.*
- e. *Groundwater gradients, to the extent known, and direction of groundwater flow.*
- f. *The ingestion protective concentration level exceedance zone for each contaminant of concern, to the extent known.*
- g. *Depth to groundwater for each affected zone.*

# **Appendix D**

## APPENDIX D

For each contaminant of concern within the designated groundwater:

- a. A description of the ingestion protective concentration level exceedance zone and the non-ingestion protective concentration level exceedance zone, including a specification of the horizontal area and the minimum and maximum depth below ground surface.
- b. The level of contamination, the ingestion protective concentration level, and the non-ingestion protective concentration level, all expressed as mg/L units.
- c. Its basic geochemical properties (e.g., whether the contaminant of concern migrates with groundwater, floats or is soluble in water).

Based on environmental investigations at the designated property, chlorinated ethenes (tetrachloroethylene, trichloroethylene, cis- and trans-1,2-dichloroethylene, 1,1-dichloroethylene, and vinyl chloride) have been identified in the shallow groundwater bearing unit (GWB) at concentrations which exceed the ingestion protective concentration levels ( $^{GW}GW_{ing}$ ). PCE, TCE, cis-1,2-DCE, 1,1-DCE, and VC were detected at concentrations above the residential groundwater ingestion ( $^{GW}GW_{ing}$ ) PCL during the initial groundwater monitoring event in December 2016. No COCs have been identified in Site soil at concentrations which exceed the TCEQ TRRP direct exposure total soil combined ( $^{Tot}Soil_{Comb}$ ) or air soil inhalation ( $^{Air}Soil_{Inh-V}$ ) PCLs.

A description of each COC, the ingestion and non-ingestion PCL Exceedance (PCLE) Zone, vertical and horizontal extent, and geochemical properties is provided below.

### COC: Tetrachloroethylene (PCE) – CAS 127-18-4

Maximum Concentration in Groundwater Since January 2021: 0.154 milligrams per liter (mg/L)  
Ingestion-Based PCL (Residential  $^{GW}GW_{ing}$ ): 0.005 mg/L

2023 Groundwater Ingestion-Based PCLE Zone

Length: 30 ft

Width: 30 ft

Min. Depth: Approximately 19 feet below ground surface (ft bgs)

Max. Depth: Approximately 25 ft bgs

Total Area: 707 square feet / 0.016 acres

Non-Ingestion - Based PCL ( $^{Air}GW_{Inh-V}$ ): 500 mg/L

Non-Ingestion - Based PCLE Zone: None

Geochemical/Physical Properties

Molecular Weight: 165.83 g/mol

Density/Specific Gravity: 1.6227 g/cm<sup>3</sup>

Solubility in Water: 150 mg/L at 25°C

Groundwater Migration Potential: High

Free-Phase Collects as Dense Non-Aqueous Phase Liquid (DNAPL)

### COC: Trichloroethylene (TCE) – CAS 79-01-6

Maximum Concentration in Groundwater Since January 2021: 0.198 mg/L  
Ingestion-Based PCL (Residential  $^{GW}GW_{ing}$ ): 0.005 mg/L

2023 Groundwater Ingestion-Based PCLE Zone

Length: 30 ft

Width: 30 ft

Min. Depth: Approximately 19 ft bgs

Max. Depth: Approximately 25 ft bgs

Total Area: 707 square feet / 0.016 acres

Non-Ingestion - Based PCL ( ${}^{\text{Air}}\text{GW}_{\text{Inh-V}}$ ): 24 mg/L

Non-Ingestion - Based PCLE Zone: None

Geochemical/Physical Properties

Molecular Weight: 131.39 g/mol

Density/Specific Gravity: 1.4642 g/cm<sup>3</sup>

Solubility in Water: 1,280 mg/L at 25°C

Groundwater Migration Potential: High

Free-Phase Collects as Dense Non-Aqueous Phase Liquid (DNAPL)

**COC: cis-1,2-Dichloroethylene (cis-1,2-DCE) – CAS 156-59-2**

Maximum Concentration in Groundwater Since January 2021: 8.72 mg/L

Ingestion-Based PCL (Residential  ${}^{\text{GW}}\text{GW}_{\text{ing}}$ ): 0.070 mg/L

2023 Groundwater Ingestion-Based PCLE Zone

Length: 30 ft

Width: 30 ft

Min. Depth: Approximately 19 ft bgs

Max. Depth: Approximately 25 ft bgs

Total Area: 707 square feet / 0.016 acres

Non-Ingestion - Based PCL ( ${}^{\text{Air}}\text{GW}_{\text{Inh-V}}$ ): 1200 mg/L

Non-Ingestion - Based PCLE Zone: None

Geochemical/Physical Properties

Molecular Weight: 96.94 g/mol

Density/Specific Gravity: 1.2840 g/cm<sup>3</sup>

Solubility in Water: 3,500 mg/L at 25°C

Groundwater Migration Potential: High

Free-Phase Collects as Dense Non-Aqueous Phase Liquid (DNAPL)

**COC: trans-1,2-Dichloroethylene (trans-1,2-DCE) – CAS 156-60-5**

Maximum Concentration in Groundwater Since January 2021: 0.0570 mg/L

Ingestion-Based PCL (Residential  ${}^{\text{GW}}\text{GW}_{\text{ing}}$ ): 0.100 mg/L

2023 Groundwater Ingestion-Based PCLE Zone: None

Non-Ingestion - Based PCL ( ${}^{\text{Air}}\text{GW}_{\text{Inh-V}}$ ): 770 mg/L

Non-Ingestion - Based PCLE Zone: None

Geochemical/Physical Properties

Molecular Weight: 96.94 g/mol  
Density/Specific Gravity: 1.2840 g/cm<sup>3</sup>  
Solubility in Water: 3,500 mg/L at 25°C  
Groundwater Migration Potential: High  
Free-Phase Collects as Dense Non-Aqueous Phase Liquid (DNAPL)

**COC: 1,1-Dichloroethylene (1,1-DCE) – CAS 75-35-4**

Maximum Concentration in Groundwater Since January 2021: 0.00770 mg/L  
Ingestion-Based PCL (Residential <sup>GW</sup>GW<sub>ing</sub>): 0.007 mg/L

2023 Groundwater Ingestion-Based PCLE Zone: None  
Non-Ingestion - Based PCL (<sup>Air</sup>GW<sub>Inh-V</sub>): 1700 mg/L  
Non-Ingestion - Based PCLE Zone: None

Geochemical/Physical Properties  
Molecular Weight: 96.94 g/mol  
Density/Specific Gravity: 1.213 g/cm<sup>3</sup>  
Solubility in Water: 400 mg/L at 25°C  
Groundwater Migration Potential: High  
Free-Phase Collects as Dense Non-Aqueous Phase Liquid (DNAPL)

**COC: Vinyl Chloride (VC) – CAS 75-01-4**

Maximum Concentration in Groundwater Since January 2021: 0.522 mg/L  
Ingestion-Based PCL (Residential <sup>GW</sup>GW<sub>ing</sub>): 0.002 mg/L

2023 Groundwater Ingestion-Based PCLE Zone  
Length: 30 ft  
Width: 30 ft  
Min. Depth: Approximately 19 ft bgs  
Max. Depth: Approximately 25 ft bgs  
Total Area: 707 square feet / 0.016 acres  
Non-Ingestion - Based PCL (<sup>Air</sup>GW<sub>Inh-V</sub>): 3.8 mg/L  
Non-Ingestion - Based PCLE Zone: None

Geochemical/Physical Properties  
Molecular Weight: 62.498 g/mol  
Density/Specific Gravity: 0.911 g/cm<sup>3</sup>  
Solubility in Water: 2,700 mg/L at 25°C  
Groundwater Migration Potential: High  
Free-Phase Collects as Dense Non-Aqueous Phase Liquid (DNAPL)

# **Appendix E**

## APPENDIX E

A table displaying the following information for each contaminant of concern, to the extent known:

- a. The maximum concentration level for soil and groundwater, the ingestion protective concentration level, and the non-ingestion protective concentration level, all expressed as mg/kg for soils and mg/L for groundwater.
- b. The critical protective concentration level without the municipal setting designation, highlighting any exceedances.

### Soil

One COC (VC) was detected at concentrations exceeding the TRRP groundwater ingestion ( $^{GW}GW_{Ing}$ ) Tier 1 PCL. **Table 1** presents the maximum concentrations of VC at the Site, compared with the applicable TRRP Tier 1 0.5-acre residential non-ingestion PCL. **Table 2** includes all available soil analytical data at the designated property.

**Table 1**

COC	0.5-Acre Res PCL ( $^{GW}Soil_{Ing}$ )		0.5-Acre Res Non-ingestion PCL ( $^{Air}GW-Soil_{Inh-v}$ )		Maximum Concentration	Sample Location, Depth, and Date
	(mg/kg)	Tier	(mg/kg)	Tier		
VC	0.022	1	42	1	<b>0.131 J</b>	<b>SB-5 (16-18 ft), 7/12/2017</b>

Notes:

mg/kg – milligrams per kilogram

**Bold** text indicates an exceedance of the screening criteria without MSD (Tier-1 Residential  $^{GW}Soil_{Ing}$ )

**Yellow** highlight indicates an exceedance of the screening criteria with MSD (Tier-1 Residential  $^{Air}GW-Soil_{Inh-v}$  for 0.5-Acre Source Area)

Table 2

**Soil Data Summary**

## Groundwater

COCs (PCE, TCE, cis-1,2-DCE, 1,1-DCE, and VC) were detected at concentrations exceeding their respective TRRP  $^{GW}GW_{Ing}$  Tier 1 PCLs. Based on the proposed response actions, institutional controls such as this MSD will be used to eliminate the groundwater ingestion exposure pathway at the designated property. **Table 3** presents the maximum concentrations of each COC, since the January 2021 groundwater monitoring period at the designated property, compared with the applicable TRRP Tier 1 0.5-acre residential groundwater ingestion and non-ingestion PCLs. **Table 4** includes all available groundwater analytical data since groundwater monitoring began at the designated property.

**Table 3**

COC	Res Ingestion PCL ( $^{GW}GW_{Ing}$ )		0.5-Acre Res Non-ingestion PCL ( $^{Air}GW_{Inh-V}$ )		Maximum Concentration since January 2021
	(mg/L)	Tier	(mg/L)	Tier	
PCE	0.005	1	500	1	<b>0.154</b>
TCE	0.005	1	24	1	<b>0.198</b>
cis-1,2-DCE	0.070	1	1200	1	<b>8.72</b>
trans-1,2-DCE	0.100	1	770	1	0.0570
1,1-DCE	0.007	1	1700	1	<b>0.00770</b>
VC	0.002	1	3.8	1	<b>0.522</b>

Notes:

**Bold** text indicates an exceedance of the screening criteria without MSD (Tier-1 Residential  $^{GW}GW_{Ing}$ )

**Yellow** highlight indicates an exceedance of the screening criteria with MSD (Tier-1 Residential  $^{Air}GW_{Inh-V}$  for 0.5-Acre Source Area)

**Groundwater Data Summary**  
**Former Baker Hughes Process and Pipeline Services Facility**  
**7721 Pinemont Drive, Houston, Texas**

# **Appendix F**

## **APPENDIX F**

*If the plume extends beyond the limits of property owners listed in this application, list the property owners of the additional property beneath which the plume(s) extend(s), and a summary of interactions with those property owners about the plume(s) and this MSD application. Please Note: You are not required under this item to notify affected property owners, only to provide a summary of who affected property owners are, and if there have been any communications. “No contact” can be an acceptable answer*

Not Applicable, as the PCL exceedances at MW-4 are believed to be impacted by an off site source.

# **Appendix G**

## APPENDIX G

*A statement as to whether the source of the plume has been removed, the plume of contamination is stable (i.e. no change), or contracting, and the plume is delineated, **with the basis for that statement**. Please include historical sampling data.*

### Stability Assessment Approach

The groundwater monitoring well network is comprised of 14 wells, of which 8 are sampled on a regular basis. Groundwater is currently impacted with contaminant concentrations exceeding TRRP Tier 1 RALs and (critical protective concentration levels [PCLs] for the Site) at two locations:

1. Monitor well MW-1, located in the middle of the Site in the immediate area of the drainage outfall from the historical parts washer drain oil/water separator, has been identified as the on Site source zone as described in the Affected Property Assessment Report (APAR) (GHD, 2018) and Addendum to the APAR (GHD, 2019) which were approved by the TCEQ on February 6, 2020. This area of contamination appears to be spatially limited, as groundwater samples collected at a second well approximately 175 feet downgradient (monitor well MW-10) have not contained any appreciable concentrations of chlorinated solvents.
2. Monitor well MW-4, located on the west boundary of the Site downgradient from neighboring industrial facilities and believed impacted by off Site sources. MW-4 is hydraulically up gradient from the on-Site source zone. This assertion was supported by the TCEQ in the February 6, 2020, APAR approval letter. Again, this area of contamination appears to be spatially limited, as groundwater from three adjacent downgradient wells (MW-7, MW-12, and MW-13) has had no detectable concentrations of chlorinated solvents over the 2016 through 2021 monitoring period. Therefore, the COCs found in this monitor well (MW-4) are not associated with the on-Site Affected Property.

Given the limited spatial extent of contaminated groundwater the statistical stability analysis focused on temporal trends in contaminant concentrations in groundwater, as no trends in spatial occurrence (i.e., plume migration) are evident in the data. The only other samples collected to date having any detectable chlorinated solvent concentrations were isolated occurrences and mainly estimated (J qualified) detections below the reporting limit. These include one sample from monitor well MW-2 in 2016 with no detections in any following samples, one sample from monitor well MW-3 in 2017 again with no detection in any following samples, and two samples from monitor well MW-5 in 2016 and 2017, that were not replicated in the subsequent sample collected at this well.

The stability of contaminant concentrations in groundwater samples from monitor wells MW-1 and MW-4 were therefore assessed on an individual well basis utilizing a statistical trend test. The selected test is the Mann Kendall (M K) trend test, which is recommended for the analysis of environmental monitoring data by the United States Environmental Protection Agency (USEPA, 2009) and the United States Geological Survey (USGS, 2020), as well as various authors of environmental statistics textbooks (e.g., Gilbert, 1987; Gibbons, 1994). Two data scopes were considered: (i) all data (2016 through 2023) representing overall trends; and (ii) recent data (2021 through 2023) representing the most current patterns in contaminant concentrations.

The Mann Kendall trend test is a non-parametric (rank based) method that evaluates a set of data for a monotonic (unidirectional) trend result. The procedure makes no assumptions regarding the shape of the trend (e.g., linear, log linear), except that the trend is in a single direction (i.e., either consistently upward or downward). In implementing the Mann Kendall trend test a significance level of 0.05 (i.e., 95 percent confidence) was used, meaning that the false positive rate (concluding a significant trend when none is present) is no greater than 5 percent. In order to accommodate the presence of censored data (non-detect results) in many data sets, the following approach was used. If a given data set contained more than 50 percent non detects or had fewer than 4 detected values, no trend testing was performed. Otherwise, any non-detect results were considered to be tied (of equal value) and having lower concentrations than any detected values. This assumption was made to prevent any variation in detection limits influencing the Mann Kendall trend test results. The data were also screened for any cases where low level detections (e.g., J qualified estimated values) were present below reporting limits resulting in ambiguous comparisons with non-detect results and requiring accommodation on a case by case basis (e.g., treating the low detect as a non-detect or excluding non-detect results from the trend test).

A second set of statistical group comparison tests were applied to supplement the findings of the M K test, specifically either the Student's t test or the Mann Whitney/Wilcoxon Rank Sum test was utilized to compare mean (t test) or median (M W/WRS test) concentrations between the quarterly samples from 2021 through 2023 versus 2016 and 2017. This second set of analyses was performed due to the observation of a time gap in the middle of the monitoring record, where no samples were collected during the 2018 through 2020 period. The M K trend test makes an implicit assumption that the sampling interval is consistent across the period of interest and gives each successive observation equal weight in the test. Since the Site's monitoring data have the noted time gap in the middle, the group comparison tests (t test and M W/WRS) look for a change in conditions during the recent (2021 through 2023) sample group as a whole compared to the historical (2016 and 2017) sample group. By doing both sets of tests a more sensitive trend assessment is accomplished.

The two sample Student's t test (Section 3.3.1.1 of USEPA, 2006) tests for differences in the mean of two populations. This test assumes that both populations are normally distributed, or normal using a suitable transformation (e.g., gamma or log transformation) and that the population variances of the two groups are approximately equal. The t test was utilized when both recent and historical data sets had a discernible distribution and contained at least half detected values. Where this was not the case, the M W/WRS test was used instead.

The M W/WRS test compares the medians of two groups of data to look for significant differences based on a selected significance level. It is a non-parametric (rank based) test, and therefore does not make data distribution assumptions (e.g., normality) and is not strongly influenced by any outliers present. The test is slightly less powerful than the analogous parametric test (the Student's t test) under ideal conditions (i.e., normal distributions, no outliers, equal variances between groups) but is more powerful for most environmental data sets, in which skewed distributions and outlying data are frequently encountered. Additionally, the M W/WRS test accommodates censored data (i.e., non-detects) without any additional treatment or assumptions (e.g., substitution with the detection limit or a fraction thereof). The M W/WRS tests were conducted similarly to the t tests by comparing the recent data (2021 through 2023) to the historical data (2016 and 2017) group, looking for either increases or decreases (i.e., using 2 sided tests). Tests were conducted as long as a minimum of 4 detected values were present over the pooled data set. In certain cases, non-detect results with elevated detection limits (above other detected results) were present, resulting in ambiguous data comparisons (e.g., the test requires ranking results relative to one another and a result of <2.6 micrograms per liter [ $\mu\text{g}/\text{L}$ ] may not be definitively assigned as higher or lower than 0.42  $\mu\text{g}/\text{L}$ ). In these cases, the elevated non-detects were excluded from consideration in

order to be able to perform the test without any ambiguity. This occurred infrequently, and the resulting number of samples retained for testing met or exceeded base test requirements.

For all statistical testing, field duplicate results were averaged prior to statistical calculations. If one field duplicate was a detected value and the other a non-detect, the detected result was conservatively retained to represent a maximum estimate of the analyte concentration.

### **Plume Delineation Statement**

The chlorinated solvent plume at the Site has been delineated to residential, ingestion-based <sup>GW</sup>GW<sub>Ing</sub> PCLs since December 2016; and as of the groundwater monitoring event completed in June 2023, it remains delineated to the applicable <sup>GW</sup>GW<sub>Ing</sub> RALs.

### **Plume Stability Assessment Findings**

The first statistical element of the stability analysis was concentration trend testing. The results of the trend tests are presented in Table 1 (2016 through 2023) and in Table 2 (2021 through 2023) presented below. Supporting trend plots (concentration versus time) are provided in figures 1 through 16. Note, that monitor well MW-14 is not included in the tables or plots since it has only been sampled once and its groundwater did not contain concentrations of chlorinated solvents in exceedance of RALs.

Groundwater concentrations of chlorinated solvent parameters at historical source area monitor well MW-1 were observed to be stable, i.e., no statistically significant trends were observed considered the overall period and statistically significant decreasing trends were observed during the recent period.

At off Site impact area monitor well MW-4 groundwater concentrations of chlorinated solvent parameters were observed to be stable during the overall and recent periods.

Inspecting the trend plots in Figures 1 through 16, at monitor well MW-1 the groundwater concentrations of PCE and TCE are clearly elevated in 2021/2023 compared to the 2016 and 2017 period (approximately 10 times the concentrations, up to above 0.1 mg/L from the original below 0.01 mg/L concentrations. For monitor well MW-4, the chlorinated solvent concentrations appear to decrease from 2016 to 2017 to the beginning of 2021 and then increase again throughout 2021 and 2022 to end up at similar or higher concentrations than present historically. However, 2023 results appear to be lower than 2022 results.

The relative concentrations of the chlorinated solvents in groundwater appear different between monitor well MW-1 (on Site source) and monitor well MW-4 (off Site source), with the monitor well MW-1 having predominantly cis-1,2-DCE and VC, and monitor well MW-4 having fairly equal concentrations of PCE, TCE, and 1,1-DCE but proportionately more 1,1-DCE than does groundwater sampled at monitor well MW-1.

The second statistical element of the stability analysis was the group comparison test (2021 through 2023 versus 2016 and 2017). The results of these tests are provided in Table 3 of this Appendix. The results are not so comparable with the overall trend test findings (Table 1) in that PCE, TCE, and VC increased in groundwater from monitor well MW-1 between 2016 and 2017 and 2021 through 2023. However, at monitor well MW-4 results are somewhat comparable, in that cis-1,2-DCE and trans-1,2-DCE concentrations changed significantly in groundwater. The trend plots illustrate these findings.

The RALs (Tier 1 PCL values) are included on the trend plots in Figures 1 through 16 of this Appendix, which indicate that currently concentrations in groundwater collected from the wells consistently exceed the criteria for:

- cis-1,2-DCE at monitor well MW-1 (100x PCL).
- PCE, and TCE at monitor well MW-1 (50x PCL).
- VC at monitor well MW-1 (100x PCL).
- 1,1-DCE, and cis-1,2-DCE at monitor well MW-4 (<10x PCL).
- PCE, and TCE at monitor well MW-4 (20x PCL).
- VC at monitor well MW-4 (only marginally above PCL).

Other parameters have sporadically been present at concentrations above their PCLs in groundwater collected from these two wells.

## Conclusions

The limited spatial extent of chlorinated solvent impacts in groundwater under the Site makes it a good candidate for an MSD designation. Laboratory analyses of samples collected between 2016 through 2021 have consistently demonstrated that impacted groundwater is restricted to the areas around monitor well MW-1 (on Site historical source) and monitor well MW-4 (off Site source). Groundwater collected from other wells near these two, has not contained PCE, TCE or any of their breakdown products at concentrations exceeding TRRP Tier 1 PCLs, and in fact have mainly been absent entirely (i.e., not detected above lab reporting limits).

At monitor well MW-1 (on Site source area), concentrations of PCE, TCE, and VC in groundwater increased between 2016 and 2017 and 2021 through 2023 but were decreasing during 2021 through 2023. With Baker Hughes ceasing operations at the Site, the apparent change in conditions over the past 5 years could be due to activities of the current business occupying the Site, or alternatively a rebound effect of residual source material near the parts washer drain oil and water separator. In either case, sampling at monitor well MW-10 downgradient has found no detectable concentrations of any chlorinated solvents in groundwater, and thus significant migration of contamination is not evident in this area.

At monitor well MW-4 (off Site source area), chlorinated solvent concentrations in groundwater at the beginning of 2021 were generally lower than in 2016 and 2017 (see trend plots in Figures 1 through 16), increasing during 2022, but stable in 2023. This pattern may be due to a seasonal effect causing low concentrations in winter and spring 2021 and 2022 or some other variation in the off-Site source. However, once again the spatial spread of groundwater contamination in this area is currently quite limited, with no detectable concentrations of chlorinated solvents in any samples collected from the three nearest monitor wells (MW-7, MW-12, and MW-13) downgradient of the monitor well MW-4 impacts.

Under an MSD, groundwater underlying the Site would need to not pose a significant risk to human health (considering non potable use and incidental contact only) or environmental receptors. Since the limited areas of impact are under mainly paved surfaces and the water table is located approximately 12 to 18 ft bgs, human and ecological receptor exposure is not expected unless substantial digging activities occur, in which case risk control measures would be applied. With no migration of contaminated groundwater apparent in the 2016 through 2022 data, exposure at any off-Site locations (e.g., a groundwater/surface water interface) is similarly not expected. Thus, conditions at the Site appear quite favorable for an MSD.

Additional sampling in 2023 showed that concentrations of chlorinated solvents in groundwater from monitor wells MW-1 and MW-4 have been stable or decreasing over time. Statistically significant differences between

2016 and 2017, and 2021 through 2023 were still observed, therefore continuing to sample over the next 2 to 4 years could demonstrate longer term consistency in the limited spatial extent, and the continued potential stability in concentrations of chlorinated solvents in groundwater over time, underlying the Site.

In summary, the designated property meets the MSD eligibility criteria regarding plume stability due to the following:

- No ongoing source of chlorinated solvents appears to exist at the site because the historical parts washer drain oil/water separator is no longer in operation;
- While no active remedial measures have been deployed at the site, natural attenuation processes appear to be ongoing based on the presence of PCE daughter products;
- PCL exceedances of all site COCs have been delineated to the applicable RALs.
- COC concentrations at MW-1 and MW-4 have been stable or decreasing over time based on Mann Kendall trend tests.
- The all-constituent PCLE Zone in groundwater has remained stable in terms of total area from monitoring period to monitoring period.

## Notes:

>50% ND: non-detects rate between 50 and 99 percent, no test was performed.

100% ND: no detected values in the data set, no test was performed.

Statistic: calculated as the sum of the signs of all possible pair-wise data comparisons

Probability of significance: A value less than 0.05 indicates greater than 95 percent confidence of a statistically significant trend for data sets with more than 4 observations. A value less than 0.1 indicates greater than 90 percent confidence of a statistically significant trend for data sets with 4 observations

(<sup>1</sup>) One non detect (<0.00940 mg/L in April 2022) with detection limit above detected values was excluded from the trend test.

(<sup>2</sup>) Two non detects (<0.0012 mg/L in November 2017 and <0.00117 mg/L in April 2021) with detection limit above detected values were excluded from the trend test.

Notes:

Non-detects, shown by empty symbols, are plotted at detection limit.  
Trend results are reported from tests conducted at a 95 percent confidence level and were calculated for the period between 2016 - 2023.

# **Appendix H**

## **APPENDIX H**

*A statement as to whether contamination on and off the designated property without a Municipal Setting Designation will exceed a residential assessment level as defined in the Texas Risk Reduction Program or analogous residential level set by EPA, if known, and the basis for that statement.*

Without an MSD, the groundwater <sup>GW</sup>GW<sub>Ing</sub> PCLs for groundwater ingestion would be used to evaluate Site contaminants. With the use of these PCLs, environmental sampling data indicate that concentrations of COCs in the GWBU exceed respective residential PCLs for the groundwater ingestion pathway on the designated property. The PCLE zones for the chlorinated constituents are contained entirely within the designated property. Additionally, delineating monitor wells are installed outside the all-constituent PCLE zone in every direction, showing no exceedances since 2016.

Detected COCs and residential ingestion-based PCLE zone for each respective COC is presented in **Appendix C-4**. Tabulated groundwater data showing the maximum concentration of each COC and corresponding ingestion and non-ingestion-based PCLs is presented in **Table 3** in **Appendix E**.
